

ABSTRACT OF THE DISCLOSURE

A compression treatment system is provided that includes a first bladder supported about a limb. A second bladder is supported about the limb. The bladders are in fluid communication with a fluid source and the bladders are inflated such that the first bladder is inflated for a first time period and the second bladder is inflated for a second time period. The second time period is initiated within the first time period. A single pressure sensor communicates with the first bladder and the second bladder.
